

1. Project Description

My project is a personal homepage built with HTML5, CSS3, and ES6 JavaScript, using Bootstrap 5 for layout.

The homepage introduces me with:

- A profile picture and short bio
- Sections for education and interests

Additionally, the project includes a “birdhouse” page since birding is one of my major interests, which introduces common backyard birds of New England with:

- A short introduction paragraph
- A set of Bootstrap cards, each with a bird image, name, and my own thoughts on them
- A random bird fact generator (original JavaScript functionality)

The project also contains an AI-generated contact page, which lets the viewer “contact” me (although no back-end is ever implemented).

The goal is to practice front-end development while creating a page that reflects both personal and recreational content.

2. User Personas

- Prospective employer: As a professor or a recruiter from a company, this person can learn about my educational background easily and is able to contact me through my page.
- Fellow bird enthusiast: As a casual visitor who loves birds, this person can explore the birdhouse page and contact me if they want to talk more about birds.
- Friend/Classmate: As my peer, this person can browse through my pages and form their own opinions on my design choices.

3. User Stories

As a prospective employer, I want to view the homepage and quickly understand who the student is, their education, and interests, so I can see if they'd be a good fit.

As a fellow bird enthusiast, I want to click on the "Birdhouse" page and see the author's commentaries on different backyard birds.

As a classmate, I want to easily navigate through the website and be able to send a message through the contact page.

4. Design Mockups

First page: <https://wireframe.cc/VgQgG2>

Second page: <https://wireframe.cc/KXstXq>

The third page is entirely designed by AI.
